

H_{10} dissociation, STO-3G, $\delta = 0$ — one finite Hamiltonian

Open markers mark calculations that did not converge; their energies are plotted but are not converged results.

Right: negative values lie below FCI — for a fixed finite Hamiltonian FCI is exact, so this is a failure, not an improvement. The shaded band is the FCI reference's own convergence floor ($3e-12$ Ha), inside which no difference is resolved. FCI is exact only for this basis, electron number and symmetry sector; these are not chemically converged bond energies. Wall time is reported separately, in figures/h10_walltime.png.

Total energy

Signed error against FCI

— RHF — MP2 — CCSD — CCSD(T) — FCI (reference) — DMRG $\chi=500$ - - DMRG $\chi=64$
